

## RESIDENTIAL PATIO - GROVE CITY, PA

### PROJECT DESCRIPTION

Recently, a contractor who uses the FORTA-FERRO<sup>®</sup> macro fibers in his standard slab-on-grade projects had a stamped concrete patio project come up and he wanted to test the FORTA-FERRO<sup>®</sup> for finish ability in this application. A dosage of 7.5 lbs. / cu. yd. of 2-¼" length FORTA-FERRO<sup>®</sup> was chosen in this 4" thick, 5 yard stamped concrete slab. The surface of the integral colored concrete was first striked off and then two different shake colors were then applied to the surface, after which the surface was bull floated and lastly a Fresno was used. Once this was complete the shake hardener was applied. The end result after pressure washing the surface was a **fiber-free surface on the stamped concrete patio**. Many stamped concrete contractors use micro fibers for the main reason they do not show on the surface. This patio shows that macro synthetic fibers, which offer **better hardened concrete benefits**, will also yield **excellent results when it comes to the visual finish of the decorative concrete**.

### KEY POINTS

- Fiber-free Surface
- Superior Finish
- Better Hardened Concrete Benefits

### DETAILS

**Date:** Summer 2013

**Location:** Grove City, PA

**Dosage:** 7.5 lbs. / cu. yd.

**Fiber:** FORTA-FERRO<sup>®</sup> 2-¼"

**Application:** Slab-on-Ground
